

Amiora Checkout & Cart Debugging Checklist

Problem Statement

Current issue:

- Product successfully add ho raha hai cart mein.
- Cart page open ho rahi hai.
- Checkout page par price load nahi ho raha.
- Order place nahi ho raha.
- Error aa raha hai:

selected option is invalid

Source:

```
if (!variant) {  
  errors.push(`${product.name}: selected option is invalid`)  
  continue  
}
```

Complete Flow

```
Product Page  
  ↓  
Add To Cart  
  ↓  
Zustand Cart Store  
  ↓  
LocalStorage  
  ↓  
Checkout API  
  ↓  
priceCartLines()  
  ↓  
Fetch Variants  
  ↓  
Calculate Price
```

↓
Create Order

Problem kisi bhi stage par ho sakti hai.

STEP 1 — Verify Product Variant Data

Product page par selected variant inspect karo.

Expected:

```
selectedVariant = {  
  id: "uuid",  
  sku: "18K-Yellow-6",  
  product_id: "uuid"  
}
```

Check:

```
console.log(selectedVariant)
```

Possible Issue

Variant object incomplete hai.

Fix

Ensure:

```
selectedVariant.id  
selectedVariant.product_id  
selectedVariant.sku
```

sab available hon.

STEP 2 — Verify Add To Cart

Check:

```
addItem({
  productId,
  variantId,
  ...
})
```

Correct

```
addItem({
  productId: product.id,
  variantId: selectedVariant.id
})
```

Wrong

```
variantId: selectedVariant.sku
```

ya

```
variantId: variantLabel
```

ya

```
variantId: size
```

STEP 3 — Inspect Cart Store

Run:

```
console.log(useCartStore.getState().items)
```

Expected:

```
[
  {
    productId: "uuid",
    variantId: "uuid",
```

```
    quantity:1
  }
]
```

STEP 4 — Clear Old LocalStorage

Old corrupted cart data problem create kar sakta hai.

Run:

```
localStorage.removeItem("amiora-cart")
```

or

```
useCartStore.getState().clearCart()
```

Then re-add product.

STEP 5 — Verify Checkout Payload

Before:

```
priceCartLines()
```

log:

```
console.log(items)
```

Expected:

```
[
  {
    product_id:"uuid",
    variant_id:"uuid"
```

```
}  
]
```

Wrong:

```
variant_id:"18k-yellow"
```

or

```
variant_id:"6"
```

or

```
variant_id:"Rose Gold"
```

STEP 6 — Verify Variant Query

Current:

```
.in('id', variantIds)
```

Check:

```
console.log(variantIds)
```

Expected:

```
[  
  "uuid1",  
  "uuid2"  
]
```

Wrong:

```
[  
  "18K-Yellow"  
]
```

STEP 7 — Inspect variantsById

Log:

```
console.log(variantsById)
```

Expected:

```
[  
  {  
    id: "uuid",  
    product_id: "uuid"  
  }  
]
```

Problem:

Returns:

```
[]
```

Meaning:

No variant found.

STEP 8 — Inspect mergedVariants

Log:

```
console.log(mergedVariants)
```

Should contain:

```
[
  {
    id,
    product_id,
    sku,
    purity_id
  }
]
```

If empty:

Problem is database query.

STEP 9 — Inspect variantMap

Log:

```
console.log(
  variantMap.get(line.variant_id)
)
```

Expected:

Returns VariantRow.

Problem:

Returns:

```
undefined
```

Means ID mismatch.

STEP 10 — Inspect SKU Fallback

Current:

```
variantSkuMap.get(
  `${line.product_id}:${line.variant_sku}`
)
```

Verify:

```
console.log(line.variant_sku)
```

and

```
console.log(variantSkuMap)
```

STEP 11 — Check UUID Formatting

Possible issue:

Stored:

```
61FD16EA...
```

Database:

```
61fd16ea...
```

Fix:

```
variantMap.get(
  line.variant_id.trim().toLowerCase()
)
```

Create map:

```
new Map(
  mergedVariants.map(v=>[
    v.id.trim().toLowerCase(),
    v
```

```
  })  
}
```

STEP 12 — Verify Product Exists

Current:

```
productMap.get(resolvedProductId)
```

Log:

```
console.log(productMap)
```

Problem:

Product inactive.

Query:

```
.eq('status', 'active')
```

Inactive products return null.

STEP 13 — Variant Active Check

Current:

```
if (variant.is_active === false)
```

Verify:

```
console.log(variant.is_active)
```

Problem:

Variant disabled.

STEP 14 — Stock Validation

Check:

```
variant.stock_qty
```

Problem:

Zero stock.

STEP 15 — Purity Lookup

Current:

```
purityMap.get(variant.purity_id)
```

Problem:

purity_id invalid.

STEP 16 — Price Calculation

Current:

```
computeCatalogVariantPrice()
```

Problem:

Returns:

```
null
```

or

```
finalPrice <= 0
```

Error:

```
price could not be calculated
```

STEP 17 — Database Verification

Check:

products table

Must contain:

```
id
name
status=active
making_charge_pct
```

product_variants table

Must contain:

```
id
product_id
sku
metal_weight_g
purity_id
is_active=true
stock_qty
```

metal_purities table

Must contain:

```
id  
code  
metal
```

Debug Logs To Add

Inside:

```
for (const line of items)
```

Add:

```
console.log("LINE", line)  
  
console.log(  
  "variantMap",  
  variantMap.get(line.variant_id)  
)  
  
console.log(  
  "variantSkuMap",  
  variantSkuMap  
)  
  
console.log(  
  "mergedVariants",  
  mergedVariants  
)  
  
console.log(  
  "products",  
  products  
)  
  
console.log(  
  "purities",  
  purities  
)
```

Most Probable Root Cause

1

Wrong variantId stored in cart.

Expected:

```
variantId = selectedVariant.id
```

Actual:

```
variantId = selectedVariant.sku
```

2

Old localStorage data.

3

Database variant missing.

4

Product inactive.

5

Variant inactive.

6

UUID mismatch.

Checkout payload mapping issue.

Files To Inspect

1. Product Page
2. Add To Cart Button
3. cartStore.ts
4. Checkout API
5. priceCartLines()
6. products table
7. product_variants table
8. metal_purities table

Following this checklist sequentially should isolate the issue.
